

# The ABC of Computational Text Analysis

## #4 INTRODUCTION TO THE COMMAND-LINE

Alex Flückiger

Faculty of Humanities and Social Sciences

University of Lucerne

March 24, 2023

# Recap last Lecture

- Successful installation? 
- Scripting   
automate, document, reproduce
- Any questions?

# Outline

- learn principles of the shell 
- perform shell commands 
- get practice by solving exercises 

# How to get started

## Open a Shell

macOS

- open `Terminal`
- shell type: `zsh`

Windows

- open `Ubuntu 20.04 LTS`
- shell type: `Bash`
- ~~open Windows Command Prompt~~

# Bourne-again Shell

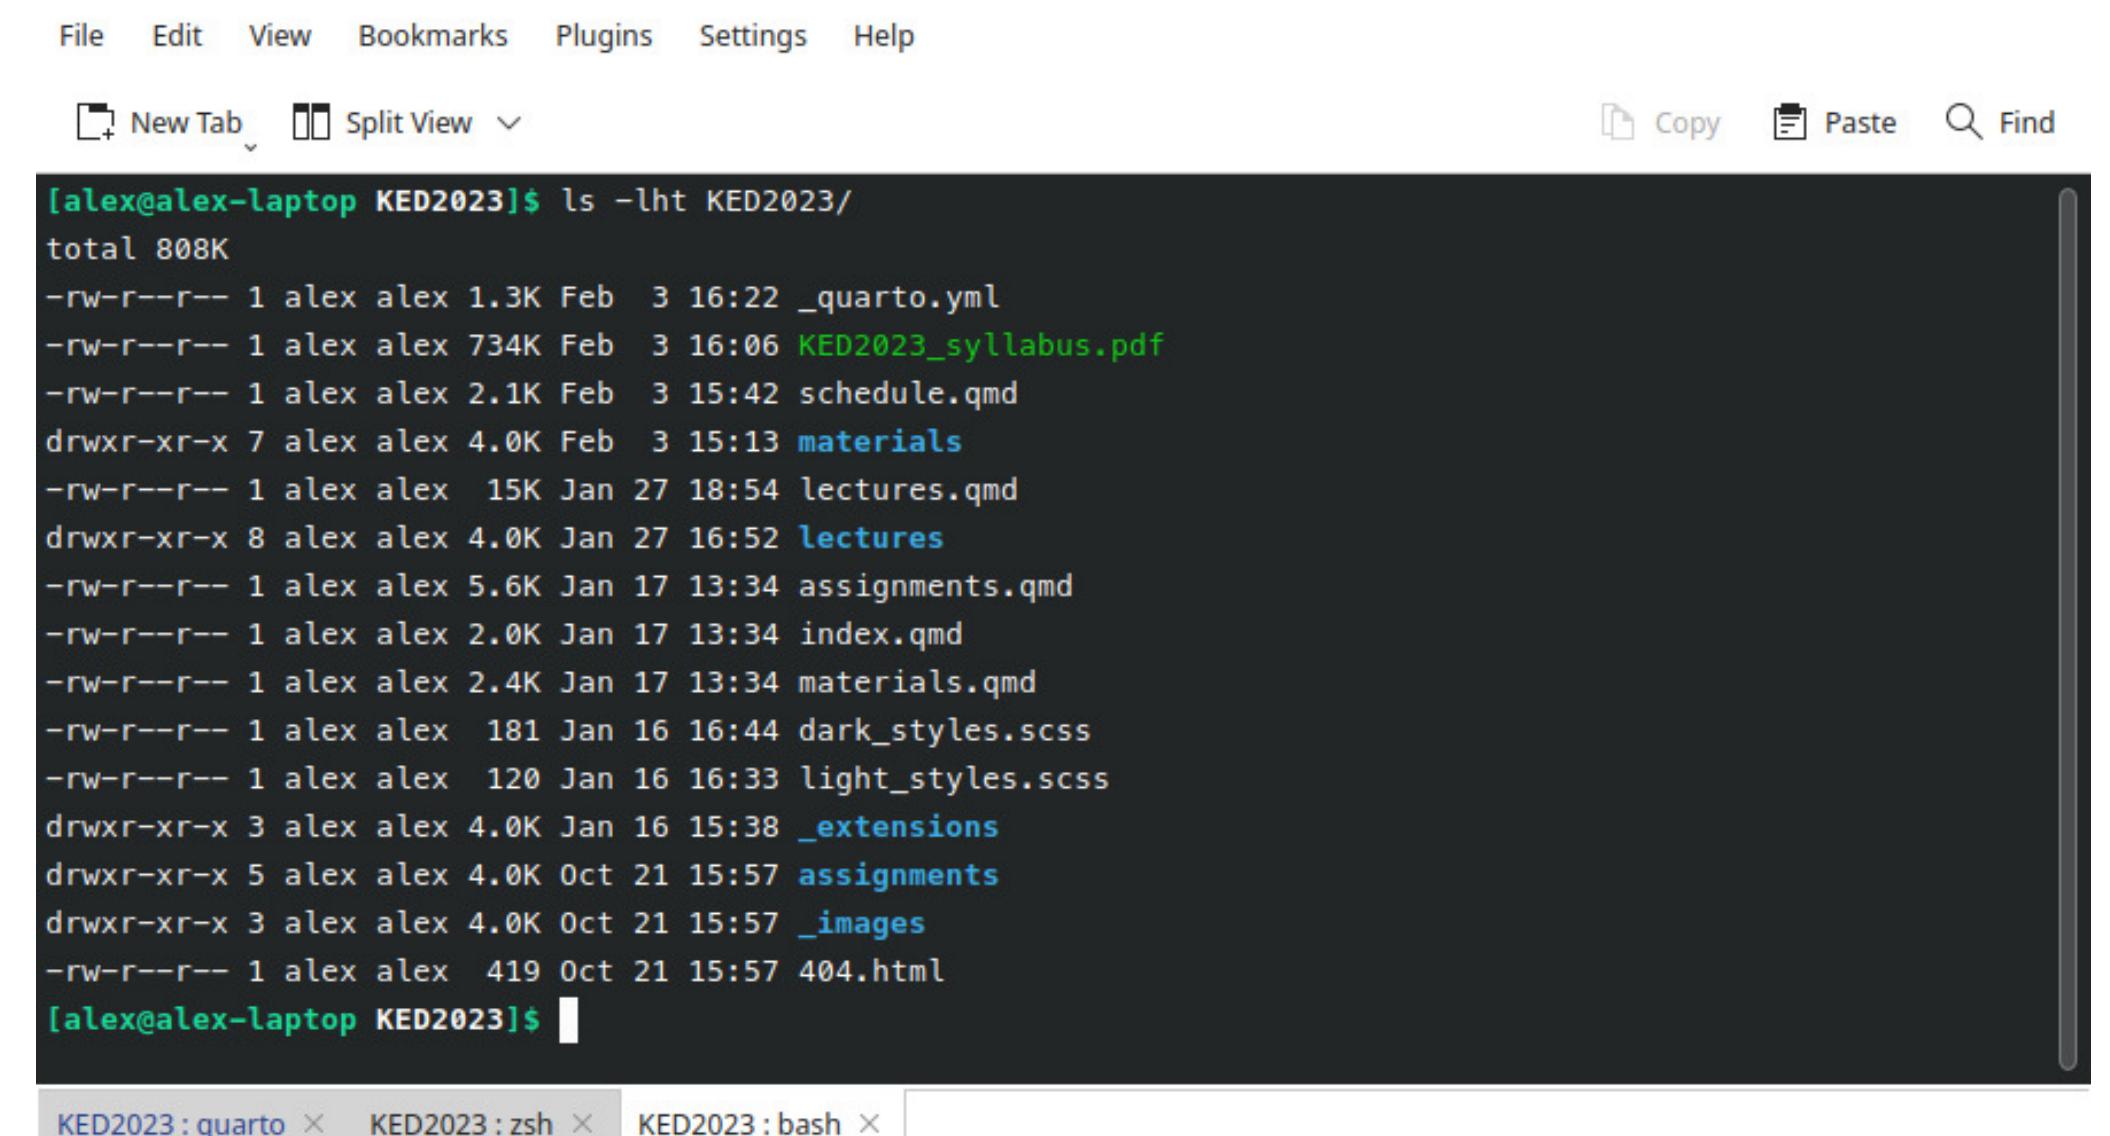

## Bash

- offers many built-in tools
- shell prompt

USER@HOSTNAME :~\$

- home directory
  - ~ refers to /home/USER
- case-sensitive
- no feedback

unless there is an issue

A screenshot of a terminal window titled 'KED2023'. The window has a dark background and contains a command-line interface. At the top, there is a menu bar with options: File, Edit, View, Bookmarks, Plugins, Settings, and Help. Below the menu is a toolbar with icons for New Tab, Split View, Copy, Paste, and Find. The main area of the terminal shows the output of the 'ls -lht' command in the directory 'KED2023/'. The output lists several files and directories with their permissions, sizes, and last modified dates. The terminal prompt '[alex@alex-laptop KED2023]\$' appears at the bottom. Below the terminal window, there is a tab bar with three tabs: 'KED2023 : quarto', 'KED2023 : zsh', and 'KED2023 : bash', with 'KED2023 : bash' being the active tab.

```
[alex@alex-laptop KED2023]$ ls -lht KED2023/
total 808K
-rw-r--r-- 1 alex alex 1.3K Feb  3 16:22 _quarto.yml
-rw-r--r-- 1 alex alex 734K Feb  3 16:06 KED2023_syllabus.pdf

[alex@alex-laptop KED2023]$
```

# Unix Philosophy

Build small programs that *do one thing*  
and *do it well.* 😎

# Basic Commands in Shell

## Say hello!

```
echo "hello world"      # print some text  
man echo                # get help for any command (e.g., echo)
```

# General Structure of Commands

## Example parts of a command

```
command -a --long_argument FILE      # non-working example command
```

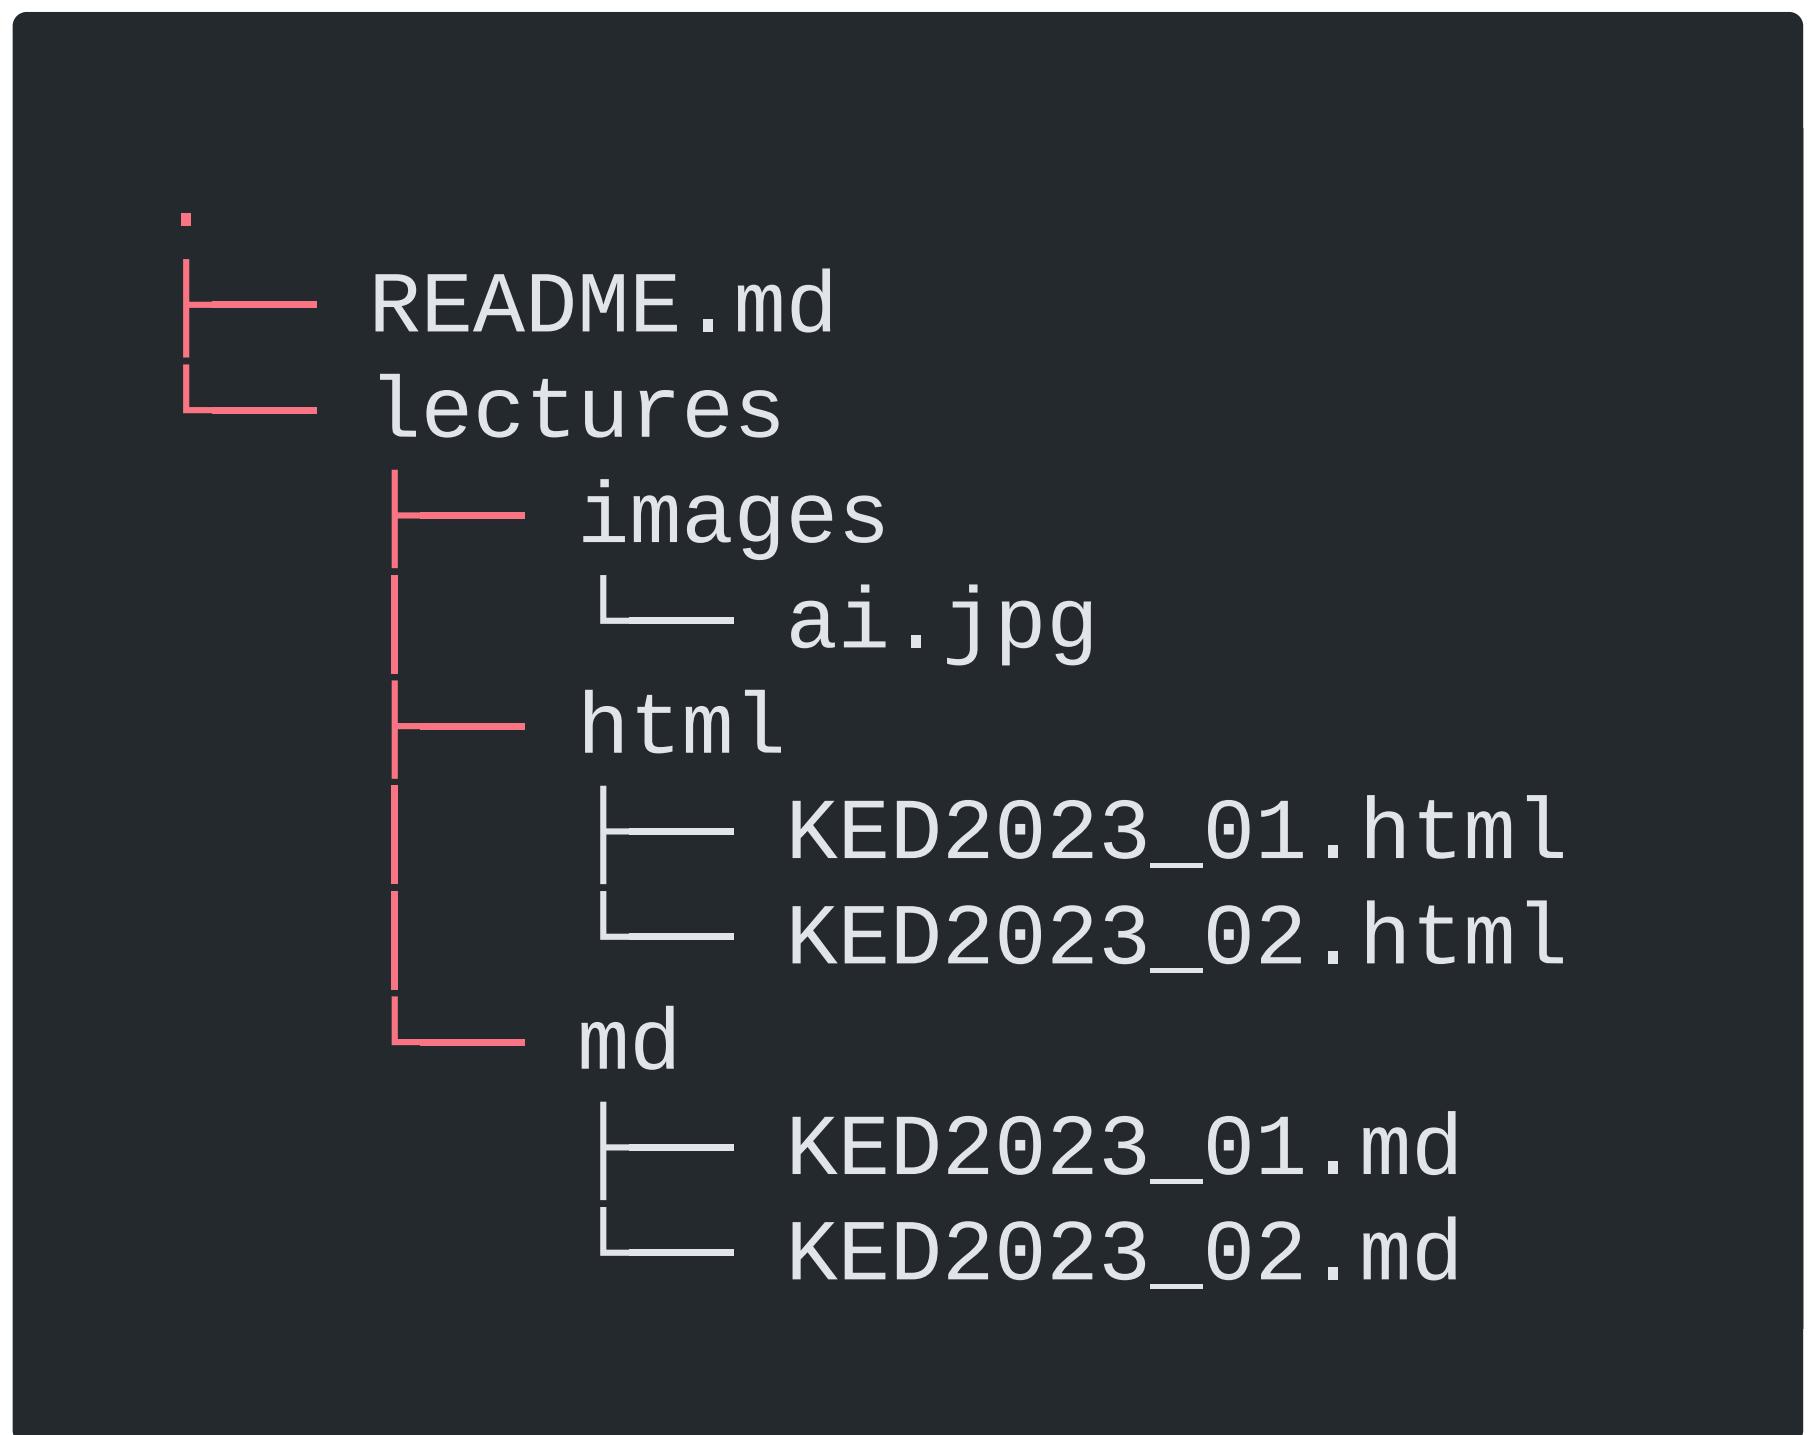

Where your Files are  
stored

# ... and how to find them

- hierarchical filesystem 

folders/directories

files with a suffix

# Relative vs. Absolute Paths

- absolute path starting from top-level directory
  - e.g. `/home/alex/KED2023/slides/KED2023_01.html`
- relative path looking from current directory
  - e.g. `KED2023/slides/KED2023_01.html`

Only relative paths work across systems

# Important Places in your Filesystem

- shortcut names of directories
  - current dir
  - parent dir
  - ~ home dir (e.g. `/home/alex`)
- find your files on Windows
  - `/mnt/c/Users/YOUR_USERNAME/`
  - shortcut with `documents`

# Navigating in a File System

```
pwd                      # show absolute path of current directory  
  
ls                       # list content of current directory  
ls -lh                   # list with more information  
ls dirname               # list content of directory dirname  
  
cd ..                    # change directory to go folder up  
cd dir/subdir            # go to folder dir/subdir (two folders down)
```

when you are lost, open file manager (GUI)

```
open .                  # open path in finder (macOS)  
explorer.exe .          # open Windows Explorer in WSL Ubuntu (Windows)
```

# Open Files

## show within Shell

```
more text.txt
```

```
# print content (space to scroll)
```

```
head text.txt
```

```
# print first 10 lines of file
```

```
tail -5 text.txt
```

```
# print last 5 lines of file
```

# Useful Key Actions

- autocomplete: TAB
- get last command: 
- scrolling: SPACE
- cancel CTRL + C
- quit: q or CTRL + D

# Creating, Moving and Copying

## create files and directories

```
touch test.txt          # create a new file  
  
mkdir data             # make a new directory  
mkdir -p data/1999     # make a new directory with a subfolder
```

## copy and move files

```
cp test.txt other/.        # copy file into other folder, keep  
mv test.txt other/new_name.txt # move or rename a file
```

# Removing Files

Watch out, there is no recycle bin. No way back!

```
rm old.txt          # remove a file  
rm -r old_data    # remove a folder with all its files
```

# In-class: Exercises I

1. Create a new directory called `tmp`.
2. Change into that directory using `cd` and print its absolute path using `pwd`.
3. Use `touch` to create a new file called `magic.txt` in `tmp`.
4. Rename the file from `magic.txt` to `easy_as_pie.txt`.
5. Check out the helper page of `mv` command.
6. Look around in the filesystem using `cd` and `ls`.

How is that useful? 🤔  
We are getting there!

# Wildcards

placeholders to match ...

- any single character: ?
- any sequence of characters: \*

```
mv data/*.txt new_data/.      # move txt-files from to another subfold  
cp *.txt files/.            # copy all txt-files in a single folder
```

# Searching

list certain files only

```
ls *.txt      # list all files with the suffix .txt (in current direct
```

find specific files

```
# search on content  
grep -r "Europe" /path/to/dir    # find all files containing X in a d
```

# Expansion

## batch processing with expansion

```
touch text_{a..c}.txt
# is equivalent to
touch text_a.txt text_b.txt text_c.txt

mkdir {2000..2005}{a..c}
# is equivalent to
mkdir 2000a 2000b 2000c 2001a 2001b 2001c ...
```

# Operators

# Combining Commands

use shell operators to ...

- redirect output into file (overwrite): `>`
- append to existing file: `>>`
- stream to next command: `|` (pipe)

```
echo 'line 1' > test.txt      # write into file
more test.txt | tail -1       # pass output to next command
```

Learn more about operators 

# Merging Files

```
cat part_1.txt part_2.txt      # concatenate multiple files  
cat *.txt > all_text.txt      # merge all txt into a single one
```

# Follow Conventions

- no spaces/umlauts in names
  - alphanumeric, underscore, hyphen, dot
- files have a suffix, folders don't
  - `text_1.txt` vs. `texts`
- descriptive file names
  - `SOURCE/YEAR/speech_party_X.txt`
- don't modify the raw data

# Writing a runnable Script

## Example script: **TODO . sh**

```
#!/bin/sh  
  
TODO
```

- file with suffix **. sh**
  - one command per row
  - # precedes comments
- start script with Shebang **#!/bin/sh**
- execute with **bash SCRIPTNAME.sh**

The beauty of scripting is automation. 

# Assignment #1

- get/submit via OLAT
  - starting tonight
  - deadline: 31 March 2023, 23:59
- discuss issues on OLAT forum
- ask friends for support, not solutions

Questions?

# In-class: Exercises II

1. Create a new file with touch.
2. Write the following content into that file, one line at a time using the append operator:

```
How about making programming a little more accessible? Like:  
from human_knowledge import solution
```

3. Make sure that the content was written into that file using more.

# In-class: Exercises III

1. Navigate up and down in your filesystem using `cd` and list the respective files per directory with `ls`. Where can you find your personal documents? Print the absolute path with `pwd`.  
A hint to Windows users as they are working in a Ubuntu subsystem, have a look at: `/mnt/c/Users`
2. Read `man ls` and write an `ls` command that lists your documents ordered by recency (time)  
by size
3. Use the `|` and `>` operators to write the 3 “last modified” files in your documents folder into a file called `last-modified.txt` on your desktop (desktop is also a directory). It is a single command performing multiple operations, one after another.
